Human

receptor

Identifying peptide(s) binding specifically to protein target - by expressing on phage surface and testing for binding to immobilised oligo:peptide derived from the target, useful for, e.g. identifying specific antibodies

WPI; 1998-240964/21.

method for the identification of a peptide able to bind specifically to a target protein. The method comprises displaying the peptide on the surface of a replicable display package, synthesising oligopeptides derived from the target protein on a solid phase, and testing for binding between the peptide and oligopeptides. The method is used to screen_large peptide libraries, especially to detect antibodies, or their fragments, that bind to cell markers or that can differentiate between different forms of the same protein, including bispecific antibodies that bind to wo non-overlapping epitopes on the same monomeric antigen or two epitopes on different molecules. The genes/oligonucleotides that encode selected peptides can be isolated and used for recombinant production of antibodies. Selected antibodies are used, e.g. for immunohistochemical or immunofluorescent analysis, and also to detect cell transformation caused by mutation in 'antioncoenes.'

domain of CD64. They were synthesised on 25 polyethylene rods adjacent, non-overlapping sets. Peptide specific phages were affinity binding to the CD64-covered rods. The specification

Synthetic oligopeptides W60537-61 are derived from the extracellular

25 polyethylene rods as

The specification describes

isolated

Three-dimensional structures and models of Fc receptors, useful in computer-assisted drug design

This amino acid sequence was predicted from the cDNA sequence of cDNA clone p98/X2. It differs from the sequence predicted from clone p135 (see Q21178) at position 25, p135 encodes a Ser residue while clone p98/X2 predicts a Thr residue. At position 58, p90

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     reduce IgG- or IgE-mediated tissue damage, e.g. IgG- or IgE-mediated hypersensitivity, recruitment of inflammatory cells or release of inflammatory modulators. The therapeutic compositions can also be used to treat disease in animals. The knowledge of the 3-D structure of Fc-gamma RIA and models of other FcR provides a means for designing and producing compounds that regulate immune function and inflammation in an animal, including humans (i.e. structure based drug design). For example, chemical compounds can be designed to block binding of immunoglobulin to chemical compounds can be designed to block binding of immunoglobulin to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (see Q21180) predicts Val and p98/X2 predicts Leu. Sequences predicted from all 3 clones show the typical features of a type I integral membrane protein and include a short hydrophobic signal sequence, a single 21-residue hydrophobic membrane-spanning domain, and a short, highly charged cytoplasmic domain. The extracellular portion contains six potential N-linked glycosylation sites and six Cys residues distributed among three C2 set Ig-related domains. A fusion protein of FCRI and a receptor ligand will be helpful to
            The amino acid sequence (R91439) of human FCRI was detd. from a CDNA library using an immunoselection cloning method. FCRI is a high affinity receptor for the Fc portion of IgG, normally located on cell surfaces of macrophages. 2 Other CDNA clones, pl35 (T14717) and p90 (T14719), coded for a variants of the FCRI sequence; the C-terminal sequence
           macrophages. 2 Other cDNA clones coded for a variants of the FcRI
                                                                                                                                     Cloning of cDNA encoding cell surface of diagnostic and therapeutic proteins

                                                                surfaces other than macrophages,
                                                                                                                                                                                                    (panning on) an antibody-coated substrate such as a culture dish. CSA nucleic acids isolated by the method of the invention, and the proteins they encode, are useful for immunodiagnostic and
                                                protein of FcRI and a receptor
                                                                         animals, including humans. These disorders include asthma, immune-complex disease, amyloidosis, parasitic diseases or multiple sclerosis. FCRI is a high affinity receptor for the FC portion of IGG, normally located on the cell surfaces of macrophages. The ability to interfere with such bonding, or to cause it to occur on surfaces of the relation macrophages.
                                                                                                                                                   animals, including humans.
                                                                                                                                                                                                                                                      physical selection of cells expressing the antigen by adhesion to
                                                                                                                                                                                                                                                                          based upon transient expression of a CSA in eukaryotic cells and
                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated nucleic acid molecule encoding the CD19 cell surface antigen, useful for immunodiagnosis and immunotherapy of immune-mediated infections or disorders, e.g. asthma, immune-complex disease, parasiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 2000-586382/55

The extracellular portion contains six optential N-linked glycosylation sites and six Cys residues distributed among three C2 set Ig-related domains. A fusion protein of FCRI and a receptor ligand will be helpful to increase the potency of antibodies in therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      This amino acid sequence was predicted from the cDNA sequence of cDNA clone p135. It differs from the sequence predicted from clones p98/X2 and p90 (see Q21179 and Q21180, respectively) at position 25; p135 encodes a Ser residue and the other two clones predict a Thr residue. At position 58, p135 predicts Leu and p90 predicts Val. Sequences predicted from all 3 clones show the

It differs from the sequence predicted from clone p135 (see Q21178) at position 25; p135 encodes a Ser residue and clone p90 predicts a Thr residue. At position 58, p90 predicts val while clones p135 and p98/X2 (see Q21179) both predict Leu. sequences predicted from all 3 clones show the typical features of a type I integral membrane protein and include a short hydrophobic signal sequence, a single 21-residue hydrophobic membrane-spanning domain, and a short, highly charged cytoplasmic domain. The extracellular portion contains six potential N-linked glycosylation sites and six Cys residues distributed among three C2 set Ig-related domains. A fusion protein of FCRI and a receptor ligand will be helpful to increase the potency of antibodies in therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Seed B, Aruffo A, Amiot M

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cDNA clone, p135 (T14717), obtd. from a cDNA library using an immunoselection cloning method. FCRI is a high affinity receptor for the Fc portion of IgG, normally located on cell surfaces of macrophages. Another isolated cDNA clone, p90 (T14719), coded for a variant (M00859) of the FCRI sequence, and a third clone, p9 (T14718), coded for an FCRI (R91439) having a different C-terminal sequence. A fusion protein of FCRI and a receptor ligand will be helpful in increasing the potency of antibodies in therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               US5506126-A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cloning of cDNA encoding cell surface antigen - useful for isolation of diagnostic and therapeutic proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             03-NOV-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Misc-difference
                                                                                    adhesion to an antibody-coated substrate. The method is useful for the isolation and cloning of any protein which can be expressed and transported to the cell surface membrane of a eukaryotic cell. It has been used to clone genes (see V63442-63) encoding cell surface antigens from mammalian lymphocytes (see W80440-55). The isolated genes can be expressed in a prokaryotic or eukaryotic host cells to produce the encoded protein. The invention also provides high efficiency expression vectors (see V63441 and V63444) which allow the generation of very large mammalian expression libraries. The purified genes and proteins are useful for immunodiagnostic and
                                                                                                                                                                                                                                                     expression libraries is based on transient expression of an antigen in eukaryotic cells and selection of cells expressing the antigen by adhesion to an antibody-coated substrate. The method is useful for
                                                                                                                                                                                                                                                                                                                                                                                                   This is the amino acid sequence of human Fc receptor I (FCRI), as deduced from cDNA clone p135 (see V63456) isolated using a rapid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New cloning vector and polylinker - based on existing sequences for efficient cloning and expression of mammalian cDNA(s), especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01-DEC-1992;

This is the amino acid sequence of human Fc receptor I (FcRI), as deduced from cDNA clone p90 (see X07372) isolated using a rapid immunoselection cloning method from a cDNA library expressed in COS cells. The cDNA library was constructed from polyA RNA of cells from a single patient undergoing extracorporeal interleukin-2 induction therapy. Clones p135 (see V63456) and p88 (see X07373)
                                                                                                                                                                                                                                                                                                       25-FEB-1988;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     genes can be expressed in a prokaryotic or eukaryotic host cells to produce the encoded protein. The invention also provides high efficiency expression vectors (see V63441 and V63444) which allow the generation of very large mammalian expression libraries. The purified genes and proteins are useful for immunodiagnostic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            in eukaryotic cells and selection of cells expressing the antigen adhesion to an antibody-coated substrate. The method is useful for the isolation and cloning of any protein which can be expressed and transported to the cell surface membrane of a eukaryotic cell. It has been used to clone genes (see V63442-63) encoding cell surface antigens from mammalian lymphocytes (see W80440-55). The isolated
                                                                                                                                                             Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                          Human Fc receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                07-JUN-1999

The cDNA library was constructed from polyA RNA of cells induction therapy. Clones p135 (see V63456) and p90 (see X07372) C were also obtained. A novel method for cloning cDNAs from mammalian C expression libraries is based on transient expression of an antigen by a clearly obtained. A novel method for cloning cDNAs from mammalian C expression to an antibody-coated substrate. The method is useful for the isolation and cloning of any protein which can be expressed and C transported to the cell surface membrane of a cukaryotic cell. It has been used to clone genes (see V63442-63) encoding cell surface antigens from mammalian lymphocytes (see W80440-55). The isolated C genes can be expressed in a prokaryotic or cukaryotic host cells to produce the encoded protein. The invention also provides high C efficiency expression vectors (see V6341 and V6344) which allow the generation of very large mammalian expression libraries. The immunodiagnostic and immunotical and inventors is and mammalian including the diagnostic and immunotical and continued the proteins are useful for immunodiagnostic and immunotical and including the diagnostic and immunotical and including the diagnostic and immunotical and im

physical selection of cells expressing the antigen by adhesion to (panning on) an antibody-coated substrate such as a culture dish. CSA nucleic acids isolated by the method of the invention, and the proteins they encode, are useful for immunodiagnostic and immunotherapeutic applications, including the diagnosis and treatment of immune-mediated infections, diseases, and disorders in animals, including humans. These disorders include asthma,

diseases, and disorders in

immune-complex disease, amyloidosis, parasitic diseases or multiple sclerosis. FCRI is a high affinity receptor for the FC portion of IgG, normally located on the cell surfaces of macrophages. The ability to interfere with such bonding, or to cause it to occur on surfaces other than macrophages, is useful in therapy. A fusion protein of FCRI and a receptor ligand will be helpful to increase

The present sequence is that of a human macrophage specific as deduced from cDNA clone pl35 (see A50592), which was isol

as deduced from cDNA clone p135 (see A50592), which was isolated from a cDNA library expressed in COS cells using a novel method o

based upon transient expression of a CSA in eukaryotic cells and

the invention designed to isolate CSA nucleic acids.

The method is

of.

Example 10; Column 53-55; 75pp; English.

Isolated nucleic acid molecule encoding the CD19 cell surface antigen, useful for immunodiagnosis and immunotherapy of immune-mediated infections or disorders, e.g. asthma, immune-complex disease, parasitic

The present sequence may be modified to produce recombinant versions. The recombinant recombinant for receptor consist only of the extracellular portion of the receptor and are not glycosylated i.e. they do not have transmembrane domains or signal peptides. The recombinant proteins may be used in immunoassays to determine the immune status of patients with chronic diseases of the immune system, e.g. AIDS, systemic lupus erythematosus (SLE), multiple

the potencies of antibodies in therapy.

```
This polypeptide human Fc receptor I (FCRI). FCRI cDNAs (see V81213) were isolated using a rapid immunoselection cloning method from a cDNA library expressed in COS cells. The cDNA library was constructed from polyA RNA of cells from a single patient undergoing extroorporeal interleukin-2 induction therapy. DNA sequence analysis revealed that the cDNAs encoded type I integral membrane proteins with 3 extracellular immunoglobulin domains. The invention provides a novel method for cloning cDNAs from mammalian expression libraries. This is based on transient expression of an antigen in eukaryotic cells and physical selection of cells expressing the antigen by adhesion to an antibody-coated substrate. The method is useful for the isolation and molecular cloning of any protein which can be expressed and transported to the cell surface membrane of a eukaryotic cell. CD40_cDNA (see V81198) is specifically claimed.
